Hydroponic System

NASA's Biomass Production Chamber

- Plant growing area--20 m²
 - 64 hydroponic trays supported on four growing levels
- Atmospheric volume--113 m³
- Two 30-kW fans for air circulation--400 m³ min⁻¹
- 96 400-W HPS lamps-- 750 $\mu\text{mol m}^{-2} \text{s}^{-1}$ PAR
- Two 53-kW chilling units
- Up to 150 kW of heating capability
- Atmospheric leakage rate of $\sim 10\%$ vol. day⁻¹

Event Timeline for the KSC Biomass Production Chamber

1985 – 1987

BPC constructed

1989 – 1992 **Baseline crop studies with wheat, potato, soybean & lettuce**

May 1992 - June 1992 **Lettuce production on recycled condensate**

Nov 1993 - Dec 1993 **Lettuce production on recycled minerals**

Feb 1994 - May 1994 **Wheat growth on effluent from aerobic bioreactors**

June 1995 **BPC atmosphere connected with BSAB atmosphere**

Feb 1996 - April 1996 **Atmospheric study with tomato**

June 1997 **Addition of ALSARM robotic manipulator to upper chamber**

Oct 1999 – Aug 2000 **Potato tuber induction factor (TIF) studies phase I**

Nov. 2001

BPC Decommissioned

1987 – 1988 **Early wheat grow-outs as chamber engineering improves: sealed atmosphere and computer control**

April 1992 **Separation of upper and lower chambers Added condensate recycling**

June 1992 - Sept 1993 **Testing of biogenic compounds with potato and wheat**

January 1994 **Breadboard-Scale Aerobic Bioreactor (BSAB) installed for solid waste**

June 1994 - August 1995 **Continuous vs. batch production study of potato on aerobic effluent**

Oct 1995 - Jan 1996 **Baseline crop study with tomato and soybeans**

June 1996 - Dec 1997 **Mixed wheat and potato crops in same environment**

Mar 1998 - Oct 2001 **Development of monitoring and control software (ALSACT)**

Jan 2001 – Oct 2001 **Potato Tuber Induction Factor (TIF) Studies Phase II**

BPC Crop Tests (Wheat)

Effect of Light (PAR) on Crop Yield

(from NASA Biomass Production Chamber)

Closed System Studies from BPC Studies

- CO₂ Exchange Rates
 - photosynthesis and respiration
 - influence of environmental factors
- Volatile Organic Compounds--VOCs
 - ethylene
- Effects of Super-Elevated CO₂
- Water Use Rates
- Nutrient Uptake and Movement

Photosynthesis and Respiration of Soybean Stands

Effect of CO_2 Concentration on Photosynthesis (potato)

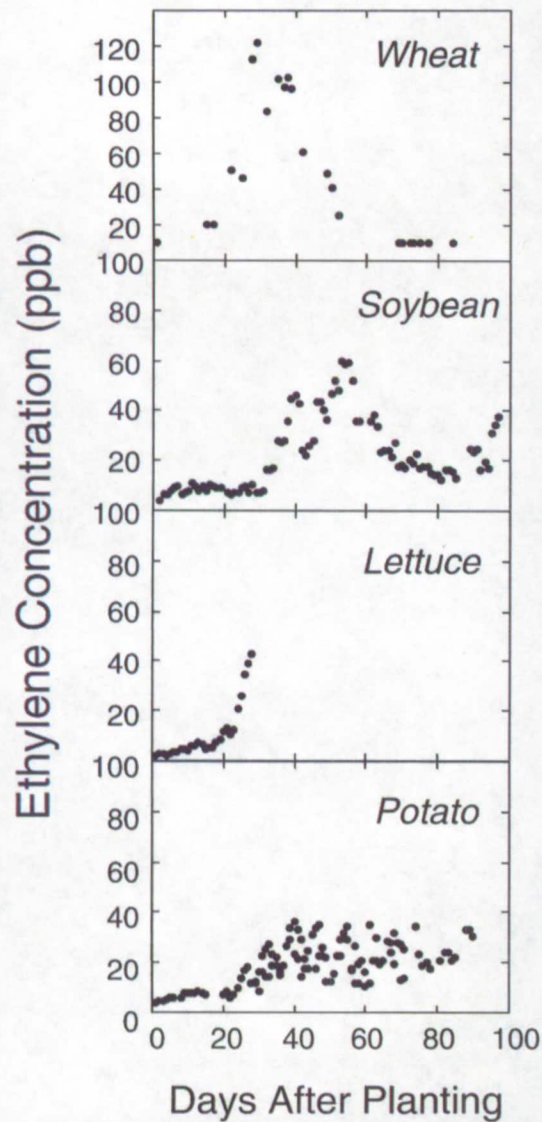

Some Biogenic Volatiles in Closed Systems

Humans ¹	Plants ²
acetaldehyde	benzaldehyde
acetone	2-butanone
ammonia	carbon disulfide
n-butyl alcohol	ethylene
carbon monoxide	2-ethyl-1-hexanol
caprylic acid	heptanal
ethanol	hexanal
ethyl mercaptan	2-hexen-1-ol acetate
hydrogen	isoprene
hydrogen sulfide	limonene
indole	2-methylfuran
methanol	nonanal
methane	ocimene
methyl mercaptan	α -pinene
propyl mercaptan	β -pinene
pyruvic acid	α -terpinene
skatole	tetrahydrofuran
valeraldehyde	tetramethylurea
valeric acid	thiobismethane

¹ Reed and Coulter (1999).

² From NASA BPC Studies (Batten et al., 1996; Stutte and Wheeler, 1997).

Ethylene Accumulation

Epinastic
Potato Leaves
at ~40 ppb

Super-Elevated CO₂ Effects on Stomata

Evapotranspiration from Plant Stand (potato)

Nutrient Uptake by Plants (potato)

Some Conclusions

- The Biomass (Plant) Production Chamber at Kennedy Space Center was operated as a closed testbed for 10 years (1988-1998).
- Results showed a close match between CO₂ flux and biomass production data.
- Manipulations of light, CO₂, and temperature showed expected responses in photosynthesis and respiration.
- A range of crop species (seed, vegetative, tuberous, and fruit) were grown successfully in recirculation hydroponics.
- Volatile organic compounds could be tracked throughout growth and development.
- No major equipment failures occurred, but some sensors, lamps, and pumps had to be replaced during the 10 years.

Some Conclusions

- The best gas exchange rates suggest that 20-25 m² of crops grown at $\sim 750 \mu\text{mol m}^{-2} \text{s}^{-1}$ PAR would provide the O₂ and CO₂ removal for one human.
- The best yields suggest that about 50 m² of crops grown at $\sim 750 \mu\text{mol m}^{-2} \text{s}^{-1}$ would provide the food (calories) for one human.

Some Conclusions

- After 10 years of near-continuous operation of the Biomass Production Chamber, system failures typically involved the support hardware, electrical power, and software.
- The plants proved to be very reliable and resilient as life support machines.

The End of the Biomass Production Chamber
